Glossar

Name	Description
Node	A "Node" is any kind of device capable of processing data and includes, without limitation, any of the following types of computer devices: mobile/smart phone, diskless workstation, personal computer workstation, networked computer workstation, homeworker/teleworker home-based system, File Server, Print Server, e-mail server, Internet gateway device, Storage Area Network Server (SANS), terminal Servers, or portable workstation connected or connecting to a Server or network. In the case of a virtual system, each virtual machine or instance running McAfee software is considered to be a node.92,37
User	A "User" for subscribers of MVISION product is defined as a unique individual person within a company, organization, or other entity, where: (1) the company, organization or other entity has acquired a valid subscription(s) or license(s) to use the product, and (2) the company, organization or other entity has authorized the particular individual person to use the product. For devices that are shared among "Users", such as printers, each device shall be counted as a single User. Q: How are licenses determined and counted in the 'per-user' subscription model? A: The number is based on the following factors: • The number of employees using devices such as laptops, desktops, mobile phones and tablets. • The number of devices used or shared by multiple users such as servers and printers. • If a maximum of 5 devices per user has been reached requiring an additional user license. In the following example: 10,000 employees (using Windows/MAC, Apple/Android Phones and Tablets) + 500 Shared devices (300 Internal Servers, 100 External Servers and 100 Printers protected by McAfee software such as Embedded Control) 10,500 MVISION licenses would be required.
OS Instance	An "OS Instance" is each occurrence of an operating system (OS) that has been installed. In the case of a physical server that has not been virtualized, then only one OS can be installed on that server. If the physical server has been virtualized, there may be multiple OS instances running.
Server Instance	(May also be referred to as Instance, AV Scanning Server, ESX Server, Virtual Instance) A "Server Instance" is a single occurrence of an operating system. Licensing for a Server Instance must be obtained for each Occurrence identified
P[+]	The Protect Plus Licensing Program is a volume purchase program that provides Customers with volumebased pricing, a license product reorder feature, and Business Technical Support.
